## Problem Statement:-

dtype='object')

**Q2.** Imagine you have a dataset where you have different features like Age, Gender, Height, Weight, BMI, and Blood Pressure and you have to classify the people into different classes like Normal, Overweight, Obesity, Underweight, and Extreme Obesity by using any 4 different classification algorithms. Now you have to build a model which can classify people into different classes.

Dataset link:- https://www.kaggle.com/datasets/ankurbajaj9/obesity-levels

```
In [1]: ## Import the necessary libraries:-
        import pandas as pd
        from sklearn.model selection import train test split
        from sklearn.tree import DecisionTreeClassifier
        from sklearn.linear model import LogisticRegression
        from sklearn.ensemble import RandomForestClassifier
        from sklearn.svm import SVC
        from sklearn.neighbors import KNeighborsClassifier
        from sklearn.metrics import classification_report
        from sklearn.preprocessing import LabelEncoder
        import warnings
        warnings.filterwarnings('ignore')
In [3]: # Load the dataset
        data = pd.read csv(r"C:\Users\hrush\Downloads\archive (3)\ObesityDataSet raw and data sinthetic.csv")
In [4]: ## Checking top 5 rows
        data.head()
                                                                                 CAEC SMOKE CH2O SCC FAF TUE
                                                                                                                      CALC
